

2023 Data Report for

Upper Long Lake, Oakland County

Site ID: 631117

42.5965°N, 83.3225°W

The CLMP is brought to you by:

About this report:

This report is a summary of the data that have been collected through the Cooperative Lakes Monitoring Program. The contents have been customized for your lake. The first page is a summary of the Trophic Status Indicators of your lake (Secchi Disk Transparency, Chlorophyll-a, Spring Total Phosphorus, and Summer Total Phosphorus). Where data are available, they have been summarized for the most recent field season, five years prior to the most recent field season, and since the first year your lake has been enrolled in the program.

If you did not take 8 or more Secchi disk measurements or 4 or more chlorophyll measurements, there will not be summary data calculated for these parameters. These numbers of measurements are required to ensure that the results are indicative of overall summer conditions.

If you enrolled in Dissolved Oxygen/Temperature, the summary page will have a graph of one of the profiles taken during the late summer (typically August or September). If your lake stratifies, we will use a graph showing the earliest time of stratification, because identifying the timing of this condition and the depth at which it occurs is typically the most important use of dissolved oxygen measurements.

The back of the summary page will be an explanation of the Trophic Status Index and where your lake fits on that scale.

The rest of the report will be aquatic plant summaries, Score the Shore results, and larger graphs, including all Dissolved Oxygen/Temperature Profiles that you recorded. For Secchi Disk, Chlorophyll, and Phosphorus parameters, you need to have two years of data for a graph to make logical sense. Therefore if this is the first year you have enrolled in the CLMP, you will not receive a graph for these parameters.

Remember that some lakes see a lot of fluctuation in these parameters from year to year. Until you have eight years worth of data, consider all trends to be preliminary.

To learn more about the CLMP monitoring parameters or get definitions to unknown terms, check out the CLMP Manual, found at: https://micorps.net/wp-content/uploads/2021/03/CLMP-Manual-2019update2_2021.pdf

Thank you!

The CLMP leadership team would like to thank you for all of your efforts over the past year. The CLMP would not exist without dedicated and hardworking volunteers!

The CLMP Leadership Team is made of: Jo Latimore, Erick Elgin, Jean Roth, Tamara Lipsey, Mike Gallagher, Melissa DeSimone, and Paul Steen

Questions?

If you have questions on this report or believe that the tabulated data for your lake in this report are in error please contact:

Upper Long Lake, Oakland County 2023 CLMP Results

Secchi Disk Transparency (feet)

Year	# Readings	Min	Max	Average	Std. Dev	Carlson TSI
2023	10	6.0	15.5	10.6	3.3	43
2018-2022	34	5.0	17.5	10.2	3.3	44
1975-2017	126	2.5	28.0	11.1	4.3	43
2023 All CLMP Lakes	2825	0.5	51.0	12.2	2.7	43

Chlorophyll-a (parts per billion)

Year	# Samples	Min	Max	Median	Std. Dev	Carlson TSI
2023	5	<1.0	3.6	2.0	1.1	37
2018-2022	8	<1.0	7.8	1.1	3.1	32
2002-2017	7	2.0	14.0	1.1	3.3	52
2023 All CLMP Lakes	687	< 1.0	43.0	3.7	5.3	43

Spring Phosphorus (parts per billion)

Year	# Samples	Min	Max	Average	Std. Dev
2023	1	18.0	18.0	18.0	NA
2018-2022	4	15.0	27.0	20.5	5.0
2002-2017	1	37.0	37.0	37.0	NA
2023 All CLMP Lakes	220	<5	220.0	20.7	21.3

Summer Phosphorus (parts per billion)

Year	# Samples	Min	Max	Average	Std. Dev	Carlson TSI
2022	1	26.0	26.0	26.0	NA	51
2017-2021	2	21.0	26.0	23.5	3.5	50
2002-2016	2	33.0	41.0	37.0	5.7	56
2023 All CLMP Lakes	234	<= 3	150.0	17.4	15.3	45

Dissolved Oxygen and Temperature Profile 7/31/23

Summary

	2023	2018-2022	1975-2017
Average TSI			
Upper Long Lake	44	44	46
All CLMP Lakes	44	41	42

With an average TSI score of 44 based on 2023 summer total phosphorus and chlorophyll data, this lake is rated as mesotrophic.

The lake keeps some dissolved oxygen in the bottom waters through early summer. By mid-summer, the lake has stratified, and the bottom water is devoid of oxygen. However, monitoring data indicates that the lake mixes again in the early fall.

There is too little data to assess long term trends. CLMP recommends eight years of consistent monitoring in order to develop a strong data baseline.

* = Minimum # samples not met for average/median/TSI value

<1.0 = Chlorophyll-a: Sample value is less than limit of quantification (<1 ppb).

W= Value is less than the detection limit (<3 ppb) T = Value reported is less than the reporting limit (5 ppb)

Trophic Status Index Explained

In 1977, limnologist Dr. Robert Carlson developed a numerical scale (0-100) where the numbers indicate the level of nutrient enrichment. Using the proper equations, we can convert results from Summer Total Phosphorus, Secchi Depth, and Chlorophyll-a to this Trophic Status Index (TSI). The TSI numbers are furthermore grouped into general categories (oligotrophic, mesotrophic, eutrophic, and hypereutrophic), to quickly give us a way to understand the general nutrient level of any lake.

The tables below give the results-to-TSI conversions for the water quality data ranges normally seen in the CLMP. The formulas for this conversion can be found in the CLMP manual (link is on page 2 of this report).

Phosphorus (ppb)	TSI Value
<5	<27
6	30
8	34
10	37
12	40
15	43
18	46
21	48
24	50
32	54
36	56
42	58
48	60
>50	>61

Secchi Depth (ft)	TSI Value
>30	<28
25	31
20	34
15	38
12	42
10	44
7.5	48
6	52
4	57
<3	>61

Chlorophyll-a (ppb)	TSI Value
<1	<31
2	37
3	41
4	44
6	48
8	51
12	55
16	58
22	61
>22	>61

TSI for Upper Long Lake in 2023	
Average	40
Secchi Disk	43
Summer TP	
Chlorophyll-a	37

Oligotrophic: Generally deep and clear lakes with little aquatic plant or algae growth. These lakes maintain sufficient dissolved oxygen in the cool, deep-bottom waters during late summer to support cold water fish, such as trout and whitefish.

Mesotrophic: Lakes that fall between oligotrophic and eutrophic. Mid-ranged amounts of nutrients.

Eutrophic: Highly productive eutrophic lakes are generally shallow, turbid, and support abundant aquatic plant growth. In deep eutrophic lakes, the cool bottom waters usually contain little or no dissolved oxygen. Therefore, these lakes can only support warm water fish, such as bass and pike.

Hypereutrophic: A specialized category of eutrophic lakes. These lakes exhibit extremely high productivity, such as nuisance algae and weed growth.

Upper Long Lake, Oakland County 2019 CLMP Aquatic Plant Results

The Aquatic Plant Identification and Mapping survey was conducted on Upper Long Lake in 2019.

This survey involves intensive sampling at multiple locations and depths around the lake produce a complete map of all aquatic plants present in a lake. A great deal of effort is involved both on the lake and back on shore to identify plants, compile data, and develop a detailed plant map, but the result is an extremely valuable record of the plant community of the lake.

Aquatic plants were sampled from a total of 45 locations (15 transects) in Upper Long Lake in 2019. Below is a list of species reported, in order of relative abundance. Survey took place August 23 - September 28. Curly-leaf pondweed (invasive) observed in lake prior to survey.

Upper Long Lake, Oakland County 2019 Aquatic Plant Identification and Mapping: Species Reported		
<u>Common Name</u>	<u>Latin Name</u>	<u>Average Density*</u>
Stonewort/muskgrass	<i>Chara sp.</i>	2.3
Coontail	<i>Ceratophyllum demersum</i>	2.2
Hybrid milfoil	<i>Myriophyllum spicatum x sibiricum</i>	2 (invasive)
Wild celery	<i>Vallisneria americana</i>	1.7
Thin-leaf pondweed	<i>Potamogeton sp.</i>	1.3
Clasping-leaf pondweed	<i>Potamogeton richardsonii</i>	0.9
Starry stonewort	<i>Nitellopsis obtusa</i>	0.8 (invasive)
Variable pondweed	<i>Potamogeton gramineus</i>	0.5
Water star grass	<i>Heteranthera dubia</i>	0.5
Slender naiad	<i>Najas flexilis</i>	0.5
Waterweed	<i>Elodea canadensis</i>	0.4
Buttercup	<i>Ranunculus sp.</i>	0.3
White water lily	<i>Nymphaea odorata</i>	0.3
Bladderwort	<i>Utricularia sp.</i>	0.3
Lesser duckweed	<i>Lemna minor</i>	0.3
Illinois pondweed	<i>Potamogeton illinoensis</i>	0.2
Sago pondweed	<i>Stuckenia pectinata</i>	0.2
Narrow pondweed	<i>Potamogeton sp.</i>	0.2
Large-leaf pondweed	<i>Potamogeton amplifolius</i>	0.1
Watermeal	<i>Wolffia sp.</i>	0.1
Bulrushes		0.1
Various-leaved milfoil	<i>Myriophyllum heterophyllum</i>	0.1
Flat-stem pondweed	<i>Potamogeton zosteriformis</i>	0.1
Floating-leaf pondweed	<i>Potamogeton natans</i>	0.1
Eurasian watermilfoil	<i>Myriophyllum spicatum</i>	0.1 (invasive)
American pondweed	<i>Potamogeton nodosus</i>	<0.1
Pickerelweed	<i>Pontederia cordata</i>	<0.1
Whitestem pondweed	<i>Potamogeton praelongus</i>	<0.1

*Lakewide. Scale: 0 (absent) - 5 (dense)

Visit the MiCorps Data Exchange (www.micorps.net) or contact the lead volunteer on your lake for more details on the survey, including sampling locations, maps, and abundance information, and for information on past surveys.

Score the Shore

Upper Long Lake does not have Score the Shore results.

Why is the Score the Shore parameter important?

Healthy shorelines are an important and valuable component of the lake ecosystem. The shoreline area is a transition zone between water and land, and should be a very diverse environment that provides habitat for a great variety of fish, plants, birds, and other animals. A healthy shoreline area is also essential for maintaining water quality, slowing runoff, and limiting erosion.

However, Michigan's inland lake shorelines are threatened. Extensive development, often combined with poor shoreline management practices, can reduce or eliminate natural shoreline habitat and replace it with lawn and artificial erosion control such as sea walls and rock. As a result, shoreline vegetation is dramatically altered, habitat is lost, and water quality declines.

Therefore, in 2019 the MiCorps Cooperative Lakes Monitoring Program introduced a new monitoring program – Score the Shore – that enables volunteers to assess the quality of their lake's shoreline habitat.

The information gathered during this assessment will allow lake communities to identify high-quality areas that can be protected, as well as opportunities for improvement. Score the Shore data, combined with educational resources describing the value of healthy shorelines and how to restore and maintain them, can be incorporated into lake management planning and used for educating lakefront property owners. The Michigan Natural Shoreline Partnership (MNSP) is a collaboration of agencies and professionals that promotes natural shoreline practices to protect Michigan's inland lakes. The MNSP website (www.mishorelinepartnership.org) includes materials and information that can be used in educational efforts. MNSP also offers training for professional educators and landscape contractors, and maintains a list of trained educators who may be available to speak to your community about natural shorelines.

Score the Shore data, just like all CLMP data, will also be available to any interested parties through the MiCorps Data Exchange (www.micorps.net). State agency staff and researchers regularly access CLMP data to better understand and manage Michigan's inland lakes.

Score the Shore is a descriptive process for assessing shoreline quality on Michigan's inland lakes. It is also a valuable educational tool. Score the Shore is not a regulatory program, nor is it intended to tell people what they can and cannot do on their property. The Michigan Department of Environmental Quality's Inland Lakes and Streams Program has responsibility for shoreline protection on public lakes. To learn about their shoreline protection program, including construction permitting and recommendations for shoreline management, visit www.mi.gov/deqinlandlakes.
